

Project Description

EPL Performance Analytics Dashboard

The **EPL Performance Analytics Dashboard** is a data analytics project developed to transform English Premier League (EPL) football data into meaningful insights for players, teams, coaches, and analysts. The project follows a complete data analytics pipeline, beginning with dataset generation and preprocessing, followed by data cleaning, SQL database integration, and interactive dashboard development.

A dataset containing over **5,000 match and player records** was prepared and processed using **Python** to clean, validate, and calculate key performance indicators (KPIs) for both players and teams. The processed data was then exported to **SQL Server**, where a unified master view was created to combine all relevant statistics into a single, structured dataset.

The final stage of the project involved developing **Power BI dashboards** that visualize player and team performance through interactive charts, filters, and KPI cards. These dashboards enable users to analyze individual player contributions, compare team performance, monitor season statistics, and identify performance trends to support data-driven decision-making.

The project demonstrates the integration of multiple technologies, including **Python, Microsoft Excel, SQL Server, and Power BI**, while applying essential data analytics concepts such as data cleaning, transformation, database management, KPI development, and business intelligence reporting. The result is a scalable analytics solution that provides clear, actionable insights into football performance and can be extended with live match data and predictive analytics in future phases.
